

Case Study

Client had trouble with swallowing correctly; presented with unstable jaw, sensation of something being stuck in throat while sleeping. Speech issues growing up with R.

Progression in 16 weeks made a significant difference in this patients life. Correct resting posture gave him better stability of his jaw and better tongue placement along with awareness to aide him in proper chewing, food collection and oral swallowing.

No longer does he feel like he is choking at night while sleeping because of better tongue placement and control. Having therapy pre and post along with a proper functional release of his short tongue frenum allowed for mobility and awareness of his tongue during normal every day breathing, eating, and swallowing with out compensation of other facial and neck muscles.
